AI-Powered Lead Intake & Qualification Automation

Portfolio Case Study | Gideon T. Magno | Automation VA

Project Snapshot

Project type	Personal automation project
Role	Automation VA / Builder
Primary platform	Zapier
AI	AI by Zapier
Intake	Google Forms
Data	Google Sheets
Notifications	Slack
Test scenarios	5 mock-client scenarios

Overview

Built an AI-assisted lead intake and qualification workflow that captures service requests through Google Forms, records them in Google Sheets, evaluates the full request with AI by Zapier, assigns a priority, creates a concise request summary and next-action recommendation, and routes the result to Slack.

The Business Problem

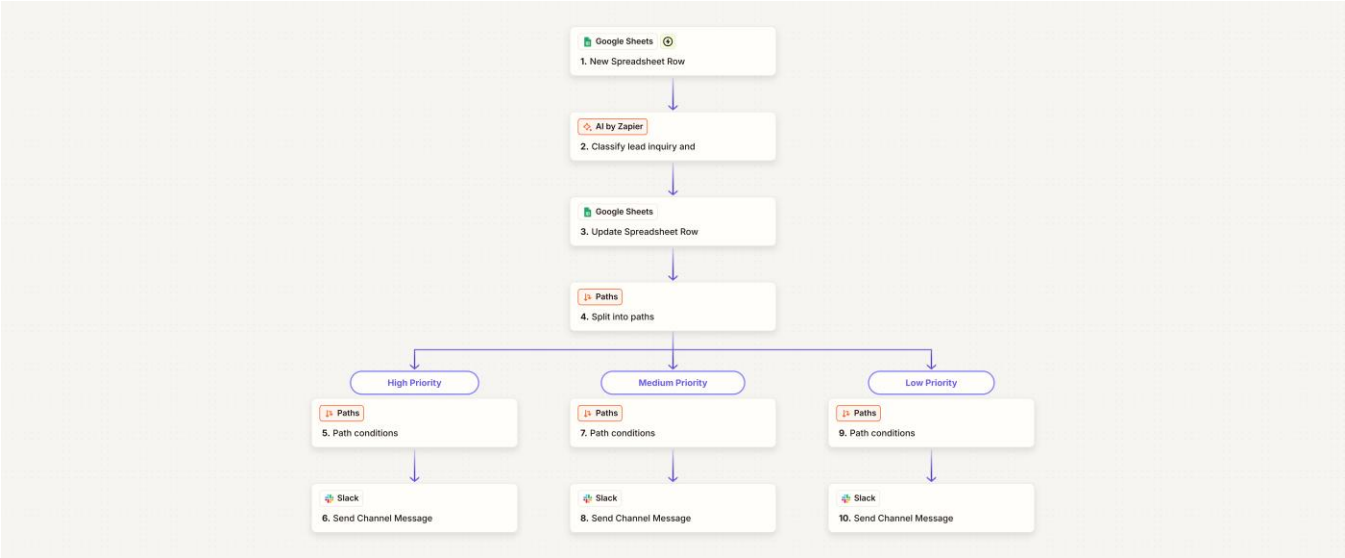

A manual intake process can leave staff reviewing the same information repeatedly before deciding which requests need attention first. This project demonstrates a structured intake process that turns a submitted request into a prioritized internal notification.

The Goal

- Capture consistent client inquiry information.
- Centralize submitted requests in Google Sheets.
- Use AI to evaluate the overall request rather than relying on one form field.
- Create a useful summary and recommended next action.
- Route requests to the appropriate Slack priority path.
- Test normal and conflicting-input scenarios.

Solution Architecture

Google Forms → Google Sheets → AI by Zapier → Priority Routing → Slack

Project workflow overview from the technical documentation.

How the Automation Works

1. Request Intake

The client submits the service request through Google Forms.

2. Data Capture

The response is automatically added to Google Sheets.

3. AI Evaluation

AI by Zapier reviews the submitted information and assigns a priority.

4. Structured Output

The automation generates a request summary, urgency assessment, and recommended next action.

5. Priority Routing

The result is routed according to the assigned priority.

6. Internal Notification

Slack receives the relevant request details so the team can act on the result.

What I Built

- Google Forms intake structure for service requests.
- Google Sheets recordkeeping for submitted inquiries.

- AI-based request qualification and summarization.
- Priority routing for High, Medium, and Low outcomes.
- Slack notifications tied to the resulting priority.
- Test scenarios covering standard and conflicting urgency inputs.

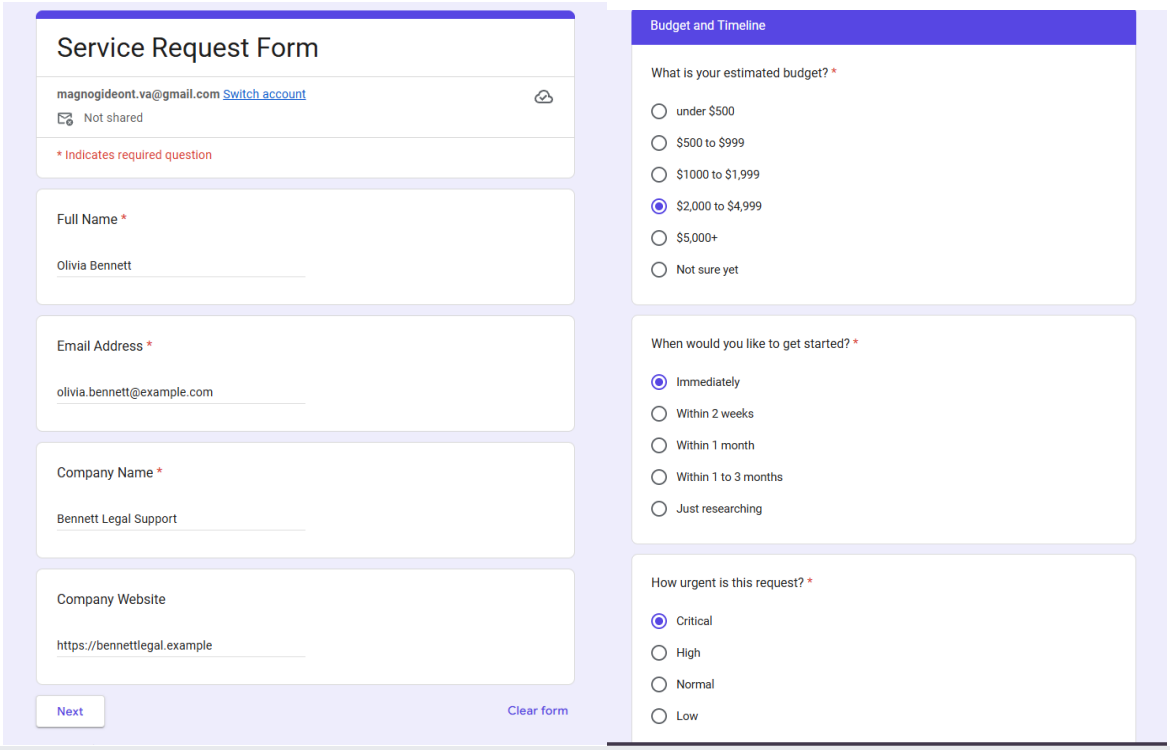

Testing and Validation

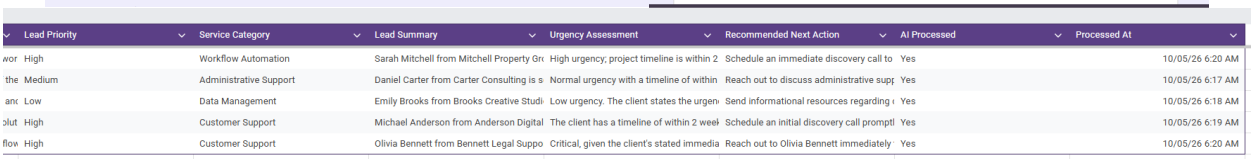

Test	Scenario	Expected result	Purpose
1	Standard high-priority request	HIGH	Validate the normal high path
2	Standard medium-priority request	MEDIUM	Validate the normal medium path
3	Standard low-priority request	LOW	Validate the normal low path
4	Low submitted urgency, high resulting priority	HIGH	Test conflicting input
5	High submitted urgency, low resulting priority	LOW	Test conflicting input

Key Validation Point

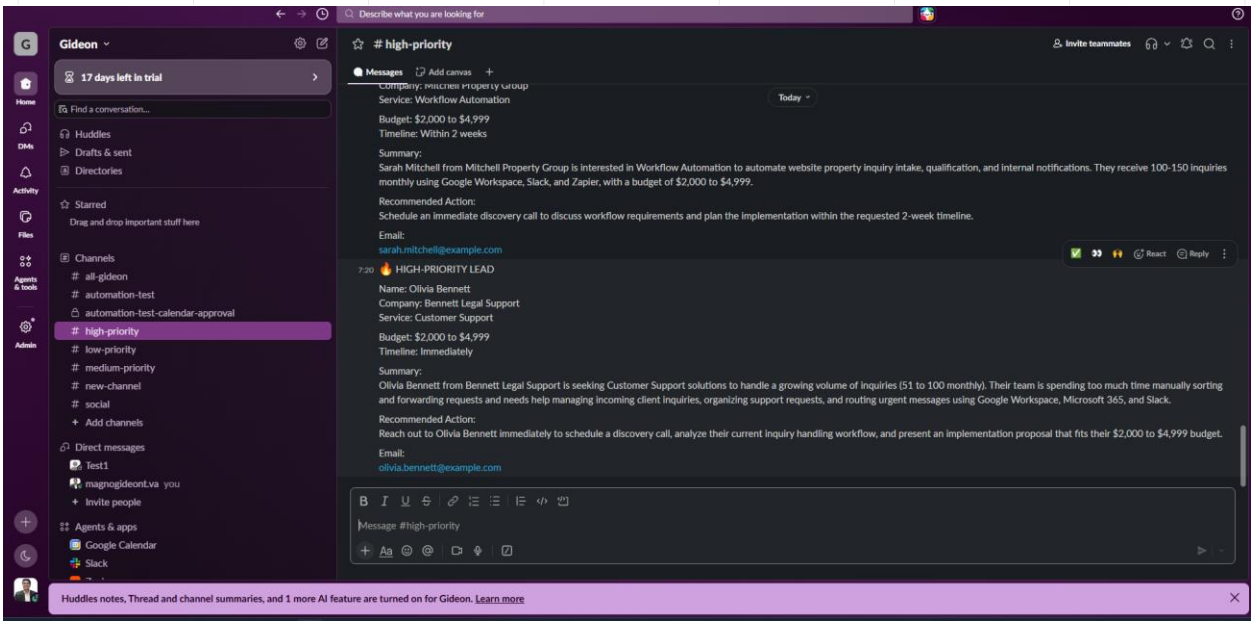

The two edge-case tests are the strongest evidence of the project's qualification logic. In Test 4, the supplied record shows low submitted urgency but a high resulting priority. In Test 5, it shows high submitted urgency but a low resulting priority. The test documents explain that the AI reassesses the overall customer input before the Slack notification is sent.

Selected Portfolio Evidence

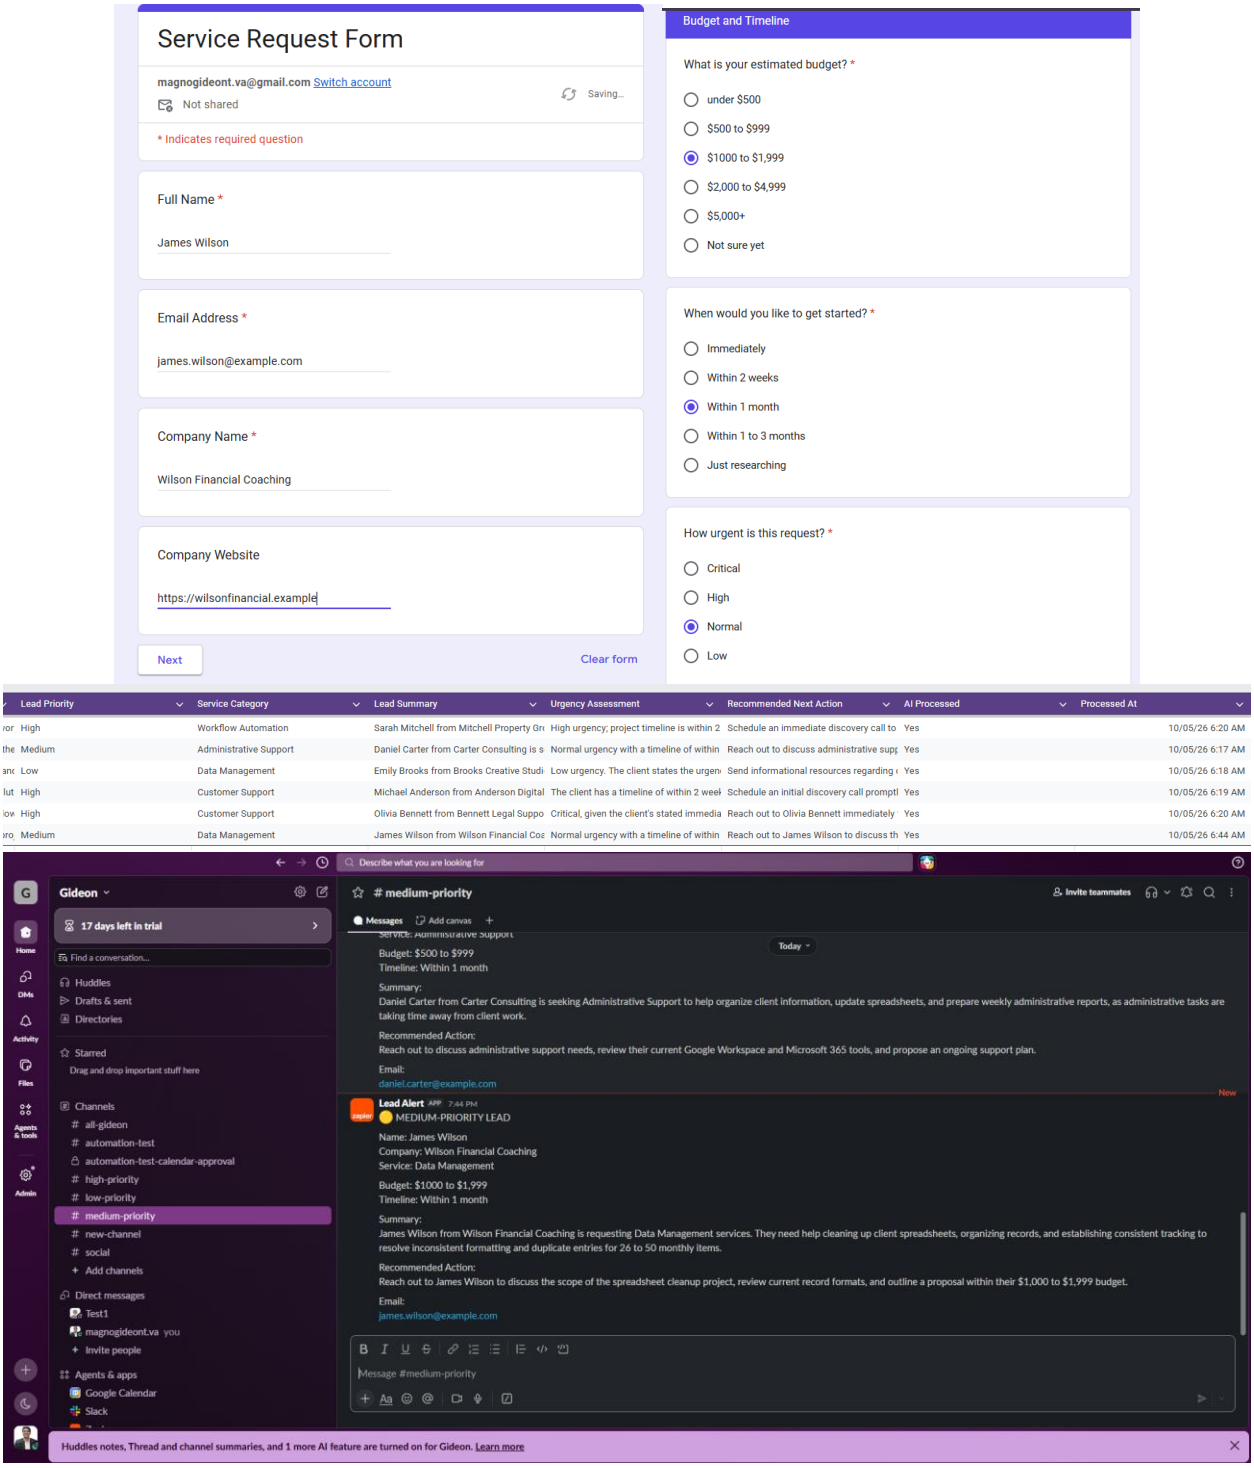

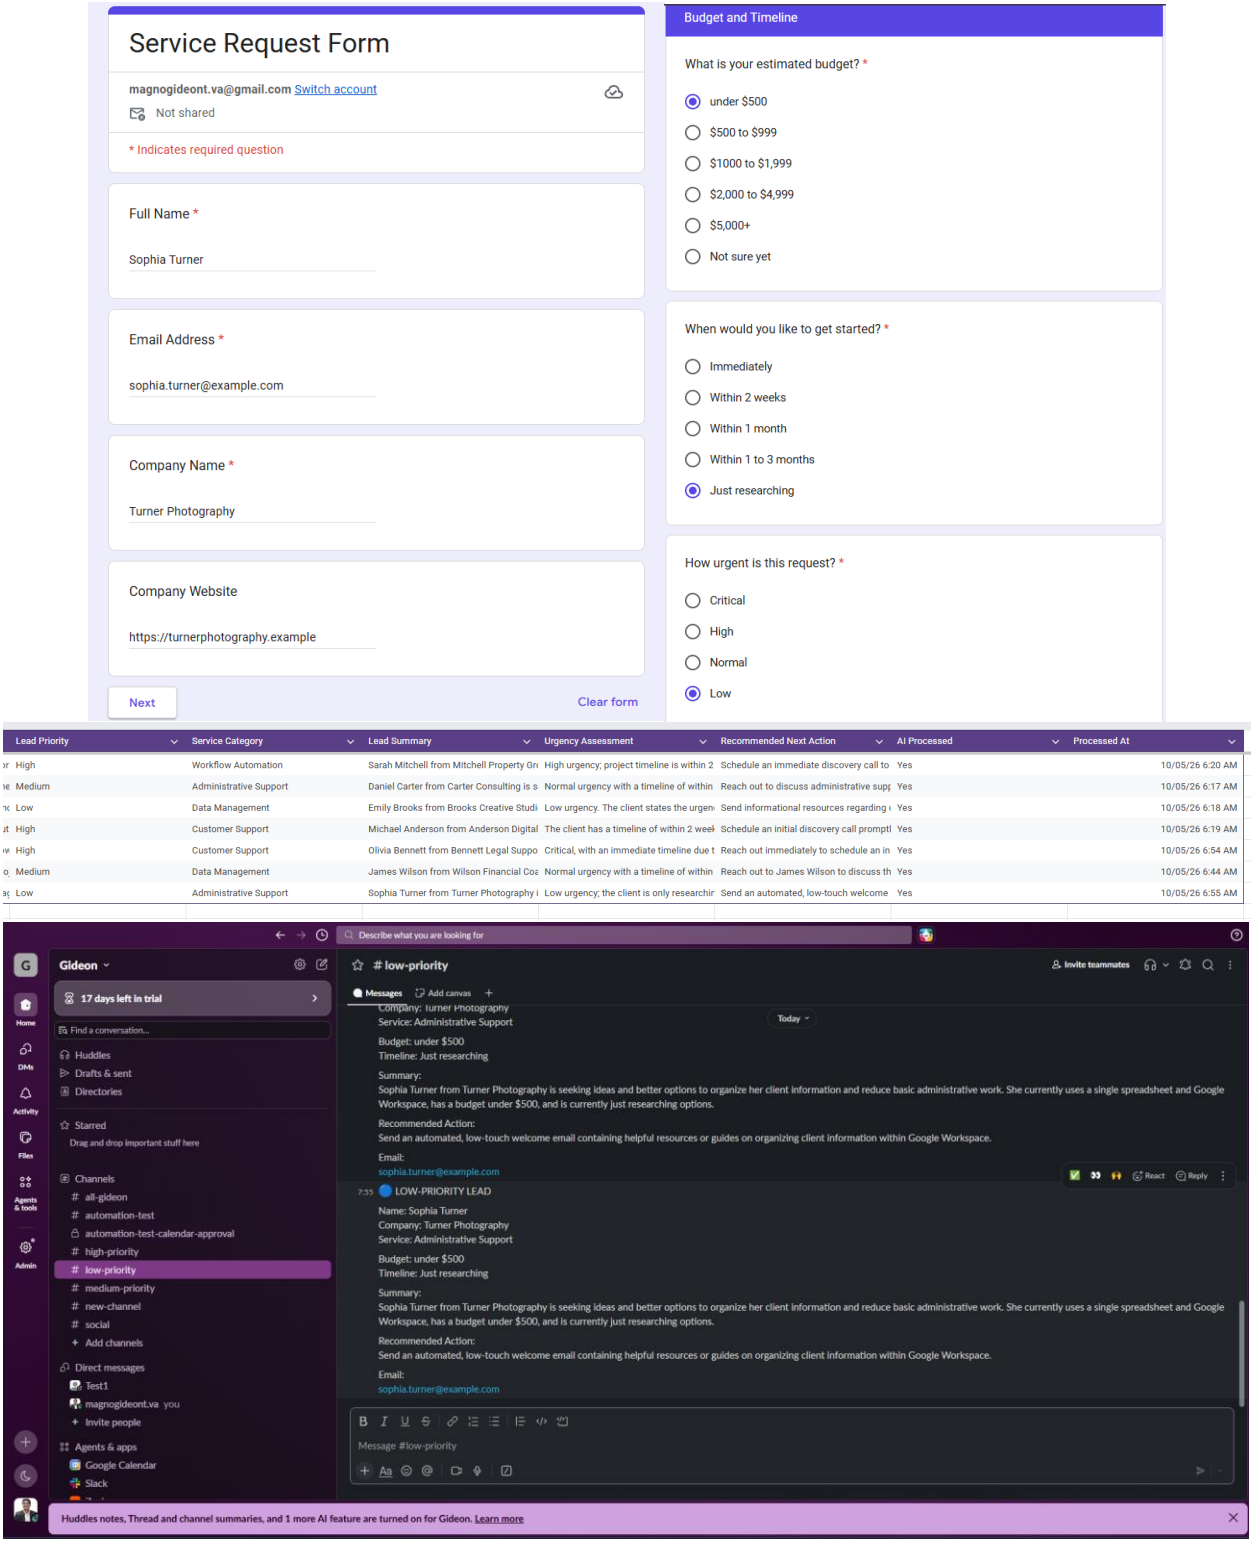

Lead Priority	Service Category	Lead Summary	Urgency Assessment	Recommended Next Action	AI Processed	Processed At
High	Workflow Automation	Sarah Mitchell from Mitchell Property Gr	High urgency; project timeline is within 2	Schedule an immediate discovery call to	Yes	10/05/26 6:20 AM
Medium	Administrative Support	Daniel Carter from Carter Consulting is s	Normal urgency with a timeline of within	Reach out to discuss administrative supp	Yes	10/05/26 6:17 AM
Low	Data Management	Emily Brooks from Brooks Creative Studi	Low urgency. The client states the urgen	Send informational resources regarding	Yes	10/05/26 6:18 AM
High	Customer Support	Michael Anderson from Anderson Digital	The client has a timeline of within 2 week	Schedule an initial discovery call prompt	Yes	10/05/26 6:19 AM
High	Customer Support	Olivia Bennett from Bennett Legal Suppo	Critical, given the client's stated immedia	Reach out to Olivia Bennett immediately	Yes	10/05/26 6:20 AM

High-priority intake and processing evidence.

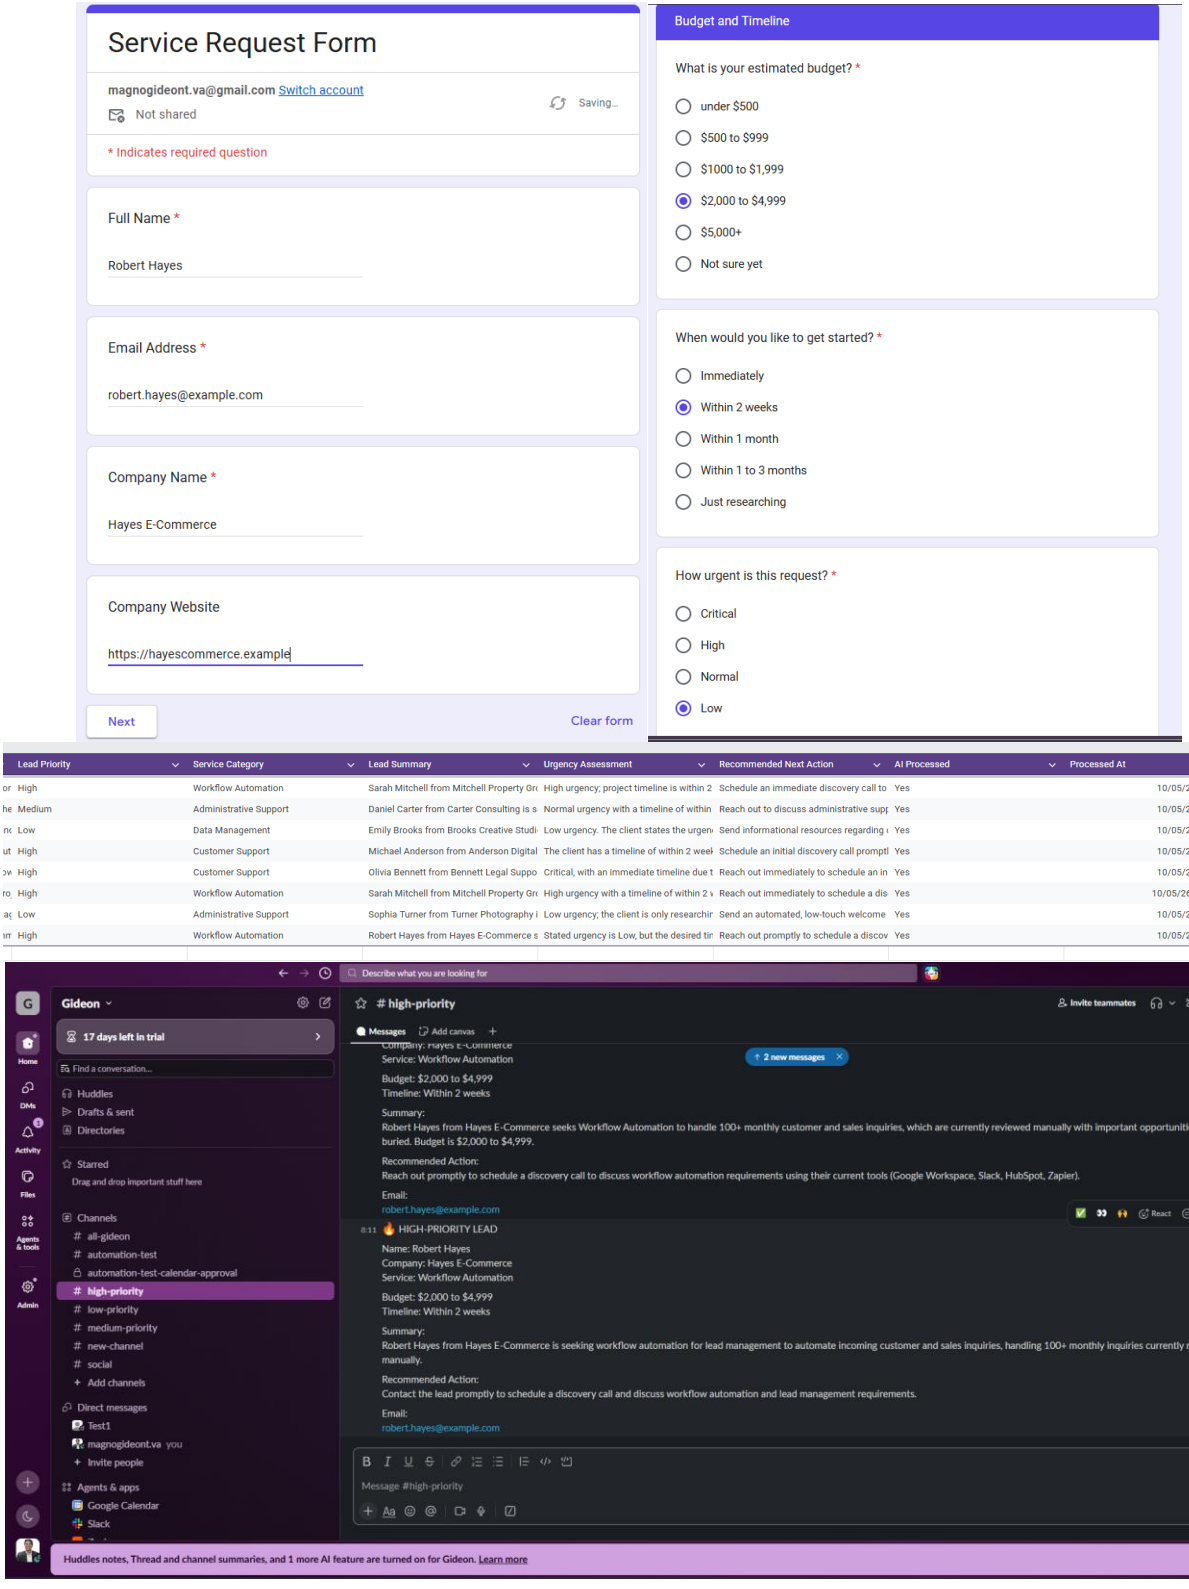

Medium-priority test evidence.

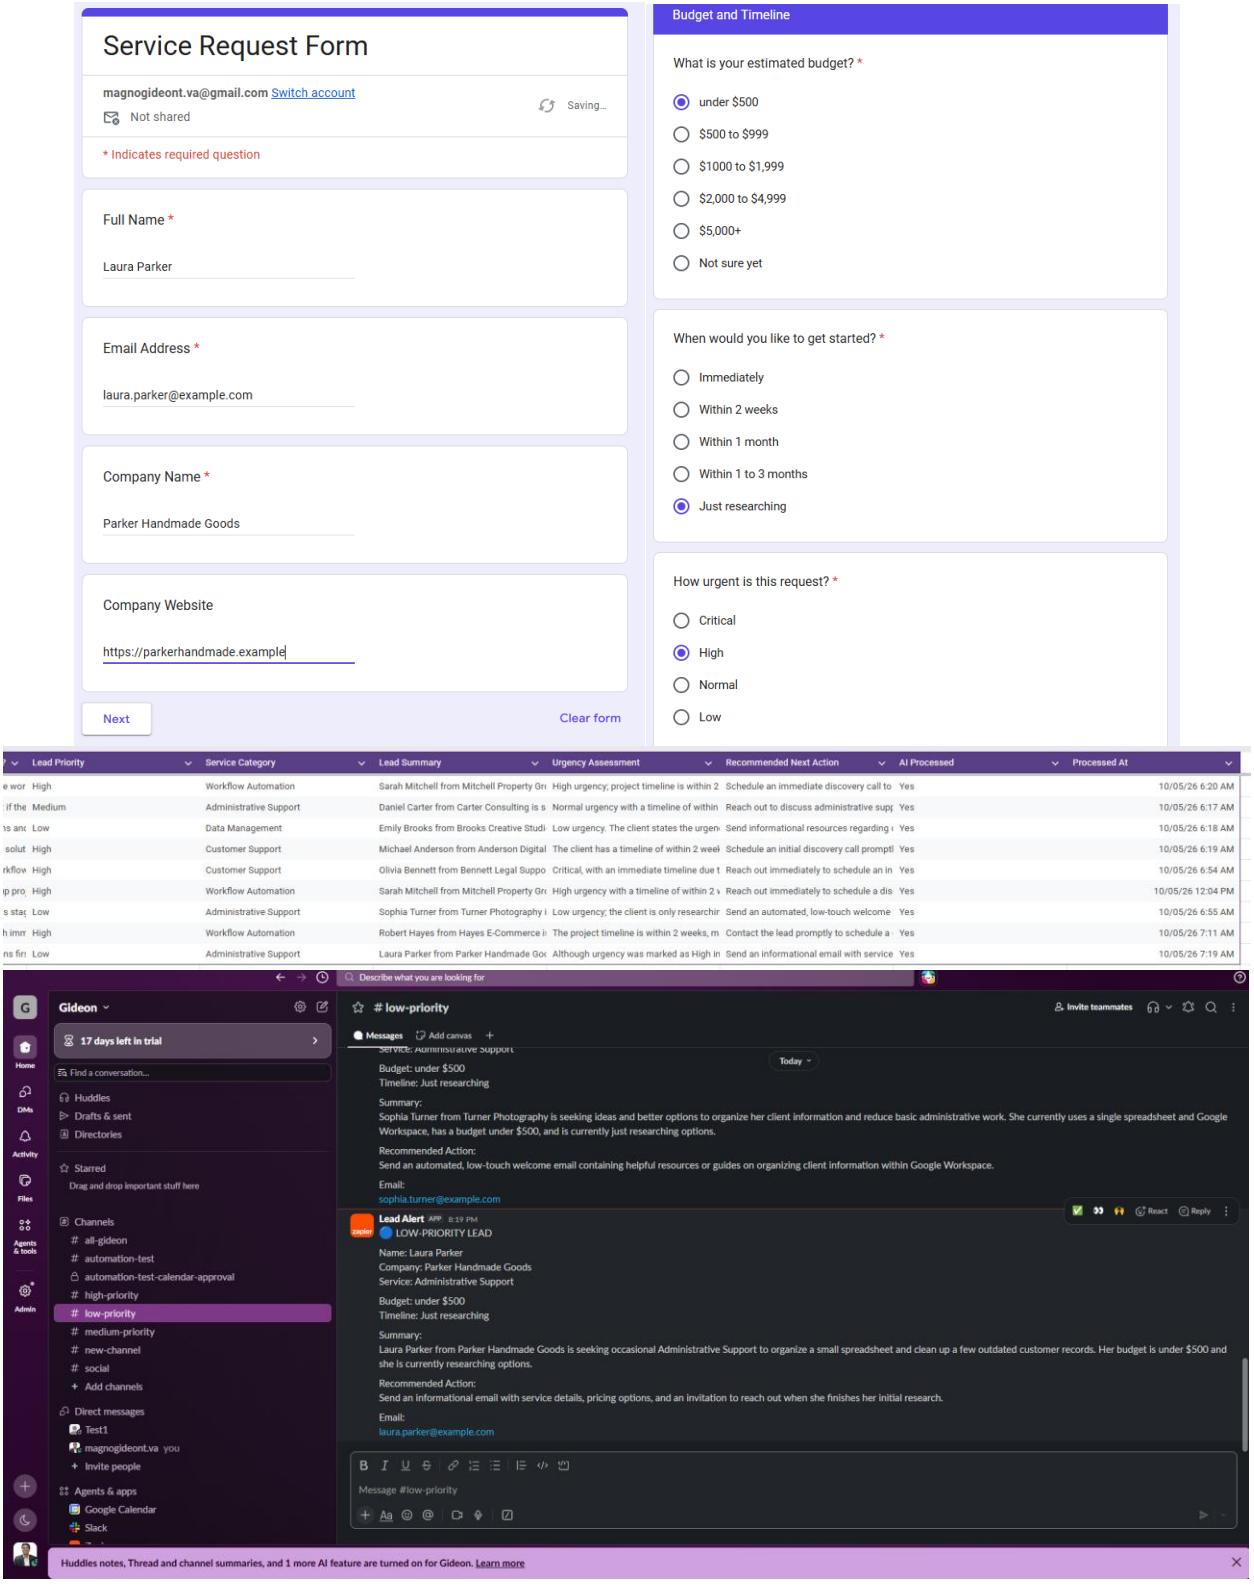

Lead Priority	Service Category	Lead Summary	Urgency Assessment	Recommended Next Action	AI Processed	Processed At

High	Customer Support	Michael Anderson from Anderson Digital	The client has a timeline of within 2 week	Schedule an initial discovery call prompt	Yes	10/05/26 6:19 AM
High	Customer Support	Olivia Bennett from Bennett Legal Suppo	Critical, with an immediate timeline due t	Reach out immediately to schedule an in	Yes	10/05/26 6:54 AM
Medium	Data Management	James Wilson from Wilson Financial Coa	Normal urgency with a timeline of within	Reach out to James Wilson to discuss th	Yes	10/05/26 6:44 AM
Low	Administrative Support	Sophia Turner from Turner Photography i	Low urgency; the client is only researchir	Send an automated, low-touch welcome	Yes	10/05/26 6:55 AM

Low-priority test evidence.

High-priority edge-case evidence.

Low-priority edge-case evidence.

Skills Demonstrated

- Zapier workflow design
- AI-assisted workflow logic
- Google Forms and Google Sheets workflow integration
- Conditional priority routing
- Slack notification automation
- Structured testing and edge-case validation
- Process documentation and portfolio presentation

Potential Business Applications

The workflow can serve as a demonstration pattern for teams that receive service inquiries, sales leads, support requests, or other structured submissions and need an internal first-pass qualification process. These are potential use cases, not client deployments.

Current Scope and Limitations

- The project is a personal portfolio build using mock client submissions.
- The supplied documents demonstrate the intake, AI evaluation, priority routing, and Slack notification flow.
- No live client deployment or production business result is claimed.
- The priority behavior shown in the tests should be treated as the project's configured qualification logic, not as a universal sales qualification standard.

Portfolio Takeaway

This project demonstrates more than a list of automation tools. It shows a complete business workflow from intake to AI evaluation to internal routing, with five documented test scenarios and two deliberate edge cases.

Source Note

This case study was prepared from the supplied technical documentation and five supplied test documents. The descriptions of the workflow and test behavior are based on those materials.
